

Europlanters

Talking
about...

Sustainable Drainage Systems.

SuDS are water management systems, designed to manage water flow in order to reduce the impact of the water cycle upon the built environment.

This has become vital with extreme weather and flooding becoming more common; sewer systems are only able to take a certain level of water flow, before being overwhelmed.

Europlanters has identified one such solution: **SuDS Planter Systems** - which not only improve the aesthetic of urban environments, but also help to retain water and minimise flooding – *with the added benefit of sustainably re-using rainwater to help your plants grow!*

We can all do our bit... it's not expensive!

Fit a water butt

- this will also save water
in the drier months

Introduce a soakaway

- this can be a gravel pit or pond

Manage water through planters

- which retain and reuse the water
